Education

University of California, Riverside

Bachelor of Science in Computer Science with Business Applications

2020 - 2024

- Relevant Courses: Data Structures & Algorithms, Machine Learning & Artificial Intelligence, Computer Databases, Object-Oriented Programming, Data Analysis

Employment

Full Stack Developer | Maple Trade Corporation - Hayward, CA

April 2025 - July 2026

- Developed a React Native (Expo) mobile app as a centralized hub for restaurant distributors, integrating Stripe for payments and Supabase for authentication and relational data persistence
- Built and shipped two full-stack Next.js e-commerce platforms from design to production: tknpaperbags.com and mapletradecorp.com.
- Hardened RESTful API routes with input validation, UUID sanitization, SQL-injection protection, rate limiting, and CORS policies, reducing attack surface across quote, form, and CRUD endpoints.
- Engineered a real-time drag-and-drop product customization tool featuring dynamic rendering, logo uploads, text overlays, auto-save, and PDF export for order submissions.
- Optimized SEO architecture and page load performance across all platforms.

Frontend Developer | Belto - Riverside, CA

April 2024 - January 2025

- Led a team of four developers through end-to-end frontend development of a React/Next.js chatbot platform for 600+ University of California students.
- Migrated an HTML/CSS/JavaScript codebase to a modular React/Next.js architecture, improving maintainability and scalability.
- Designed and implemented RESTful API endpoints for LLM-powered features using Node.js and Express, integrating locally-run models via Axios for dynamic conversational functionality.
- Streamlined onboarding for new engineers by improving code structure and Agile workflows.

Relevant Projects

LLM Evaluation Harness

- Built a full-stack LLM evaluation platform for defining test suites, benchmarking models side-by-side, and scoring outputs via four strategies: exact match, substring, regex, and LLM-as-judge with structured JSON grading
- Designed a pluggable model-adaptor architecture supporting Anthropic, OpenAI, Meta, and Gemini-compatible APIs, with run history tracking pass rates, per-case latency, and token counts.
- Benchmarked open-source models such as Qwen and DeepSeek from a personal inference server.

Database Management System

- Built a C++ database engine supporting CRUD operations over JSON and CSV files
- Implemented key-value search and filtering using RapidJSON and JSONPath query parsing

Technical Skills

Languages: C++, C, Python, HTML, CSS, JavaScript, TypeScript, SQL, Java

Technologies & Frameworks: React, Next.js, Node.js, Git, Linux, PostgreSQL, MongoDB, Express
